

## MAE 124 / ESYS 103 Midterm Study Guide

### *Objectives of the course:*

1. Introduce interaction of human activity with the “environment” in broad sense.
2. Demonstrate importance of embedding environmental dimension into industry, planning, design, economics, and politics.
3. Explore methodologies and look at case studies for accounting for environmental impacts and costs of human activity, while enabling the objective of “sustainable development” (i.e. development that meets the need of the present without compromising the ability of future generations to meet their own needs.)
4. Evaluate the severity and urgency of environmental problems and potential solutions from a variety of perspectives using knowledge and critical thinking skills developed in class.
5. Use methodologies and perspectives developed in class to quantify trade-offs for both the status quo (i.e. “business as usual”) and proposed alternatives.
6. Make informed decisions in your design for the future that account for and document the trade-offs in an objective manner.

### ***Weekly Topics and Goals***

#### *Week 1: Tragedy of the Commons*

1. Societal Collapse examples, causes
2. Tragedy of the Commons (inevitable for communal resources? Bad behavior drives out good?)
3. Tragedy of the commons applied to air quality (3 types of air pollution CFC, GHG, traditional),
4. Tragedy of the commons applied to marine ecosystems and fisheries.

#### *Week 2: Peak Oil and Energy Resources*

1. Understand links between energy usage and economy.
2. Evaluate oil, coal, and natural gas availability in coming decades and centuries.
3. Evaluate proposed plans – including “business as usual” – for meeting future energy needs of the US. Describe the challenges, proposed solutions, and the potential consequences of various solutions
4. Describe the pros/cons of all major non-renewable energy sources

#### *Week 3: Global Warming*

1. Explain the greenhouse process, how humans are enhancing the greenhouse effect, and the important feedback processes
2. Based on projections of global average temperatures in the near future (i.e. your lifetime), explain the likelihood and severity of a broad range of impacts for natural systems, humans, and the environment.
3. Apply your understanding of the scientific method, scientific reasoning, and the IPCC process to gauge the credibility of current and projected consequences of global warming. Understand current status of climate negotiations following Copenhagen talks in 2009.
4. Find flaws in the reasoning and/or methodology for typical global warming skeptics’ arguments
5. Predict the consequences for various sea level rise scenarios for the California and the world (i.e. beyond a simple increase in ocean volume).
6. Comprehensive understanding of environmental challenges facing our society from multiple, objective view points

#### *Week 4: Population, Food, Agriculture*

1. History of the Green Revolution: why Malthus’ predictions haven’t yet come true

2. Beyond the Green Revolution: GM crops and future agricultural goals
3. Potential revenge effects associated with the Green Revolution
4. Assess impact of expanding agriculture on ecosystems, and impact of converting agricultural lands to urban development.

*Week 5: Water Issues for San Diego and the World*

1. Apply knowledge of the natural hydrologic cycle, California's water history and population, and California's water delivery infrastructure to assess vulnerabilities in present and future water supplies
2. Speculate and characterize future challenges water access and availability issues (San Diego and the world) based on historical incidents
3. Speculate and characterize future challenges for clean and consistent water resources (San Diego and the world) based on understanding of the mechanisms and pathways of freshwater degradation and contamination
4. Critically evaluate the pros and cons of agriculture to urban water transfers from the perspective of various stakeholders
